## 00 Distributed database systems

## Distributed database ? What is it ?

**Distributed database system (DDBS)** is a collection of multiple logically related databases distributed over a computer network

**Distributed database management system (DDBMS)** is a collection of database systems together with software providing a required set of operations on data and management features

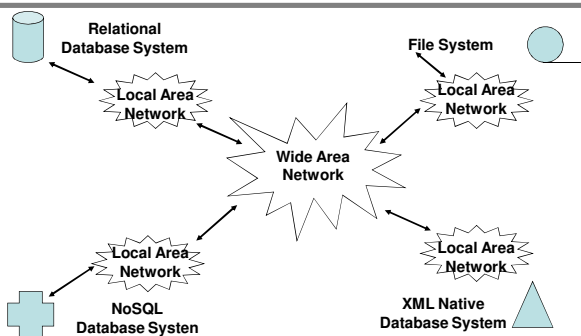

**Homogeneous DDBS** is a collection of identical database systems distributed over a computer network, e.g. a collection of Oracle systems

**Heterogeneous DDBS** is a collection of different database systems distributed over a computer network, e.g. a collection of Oracle +MySQL + DB/2 etc, systems

## Distributed DBS architecture

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 5

## 00 Distributed database systems

## DDBS versus Multiprocessor systems

**Centralized database systems** use shared transient storage (RAM) and shared persistent storage (HDD, SSD)

**Distributed database systems** use connections of database nodes over a computer network

**Distributed database systems** store logically related information

**Distributed database systems** do not require all database nodes to be identical in the terms of data, hardware, and software

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 6

## 00 Distributed database systems

**Transparency**

**Transparency** means hiding information from end users

**Data organization (distribution or network) transparency** means hiding network related information and data placement information; it is either **location** or **naming transparency**

**Naming transparency** allows for global naming of data objects

**Location transparency** allows the operations to be independent on the locations of data objects.

**Replication transparency** means that users are unaware of the existence of multiple copies of the same data objects

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 7

## 00 Distributed database systems

**Transparency**

**Fragmentation transparency** means that users are unaware of data fragmentation over many sites; it includes **vertical** and **horizontal fragmentation**

**Design transparency** means that users are unaware of how distributed database was designed

**Execution transparency** means that users are unaware of how database transactions are processed

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 8

## 00 Distributed database systems

**Autonomy**

**Autonomy** determines a level of independence of individual nodes in distributed database system

**High degree autonomy** is required for flexibility and customized maintenance of distributed database system

**Design autonomy** means a level of independence of data model usage and transaction management technique between the nodes

**Communication autonomy** means a level of independence to which a node can share information with other nodes

**Execution autonomy** means a level of independence to which users act as they please

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 9

## 00 Distributed database systems

**Advantages of DDBS**

Higher level of **reliability** and **availability**

Improved **ease** and **flexibility** of application development

Improved **performance**

Easier **expansion**

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 10

## 00 Distributed database systems

**Problems with DDBS**

Keeping track of data distribution

Distributed query processing

Distributed transaction management

Replicated data management

Distributed database recovery

Security

Distributed directory (catalog) management

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 11

## 00 Distributed database systems

**Example: Oracle 12c**

To use distributed option of Oracle a system initialization parameter **global\_names** must be set to **TRUE**

It is possible to check a value of parameter **global\_names** when connected as a database administrator

```
show parameters global_names
```

NAME	TYPE	VALUE
global_names	boolean	TRUE

It is possible to set a value of parameter **global\_names** when connected as a database administrator

```
ALTER SYSTEM SET global_names=TRUE;
```

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 12

## 00 Distributed database systems

## Example: Oracle 12c

**Global database name** uniquely identifies a database in the system

```
SELECT * FROM GLOBAL_NAME;
```

```
GLOBAL_NAME
```

```
CSCI.PC409C
```

It is possible to change a **global database name** when connected as a database administrator

```
ALTER DATABASE RENAME GLOBAL_NAME TO
jrg.f8y792s.informatics.uow.edu.au;
```

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 13

## 00 Distributed database systems

## Example: Oracle 12c

**Database link** is a connection between two physical database servers that allow a user to access them as one logical database

```
SELECT * FROM USER_DB_LINKS;
```

```
no rows selected
```

It is possible to create a **database link** when connected as an ordinary user

```
CREATE DATABASE LINK
jrg.f8y792s.informatics.uow.edu.au CONNECT TO test05
IDENTIFIED BY test05 USING 'jrg';
```

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 14

## 00 Distributed database systems

## Example: Oracle 12c

```
CREATE DATABASE LINK
jrg.f8y792s.informatics.uow.edu.au CONNECT TO test05
IDENTIFIED BY test05 USING 'jrg';
```

A name of **database link**

(jrg.f8y792s.informatics.uow.edu.au)

to a database must be the same as a **global database name** of the database linked to

```
CREATE DATABASE LINK
jrg.f8y792s.informatics.uow.edu.au CONNECT TO test05
IDENTIFIED BY test05 USING 'jrg';
```

A username (**test05**) that has a password (**test05**) must exist in the database linked to

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 15

## 00 Distributed database systems

## Example: Oracle 12c

```
CREATE DATABASE LINK
jrg.f8y792s.informatics.uow.edu.au CONNECT TO test05
IDENTIFIED BY test05 USING 'jrg';
```

A connection string (**jrg**) determines a physical location of the database linked to

It is possible to access a relational table located at a database system linked to

```
SELECT *
FROM EMP@jrg.f8y792s.informatics.uow.edu.au;
```

Relational table name: **EMP**

Database link: jrg.f8y792s.informatics.uow.edu.au

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 16

## 00 Distributed database systems

## Example: Oracle 12c

A synonym can be used to create location transparency

```
CREATE SYNONYM EMPJRG for
EMP@jrg.f8y792s.informatics.uow.edu.au;
```

```
SELECT *
FROM EMPJRG;
```

© Janusz R. Getta CSCI235/MCS9235/CSCI835 Database Systems, SCSSE, Autumn 2015 17
